Spongy Moth Trap

Spongy (Gypsy) Moth larvae aggressively feed on tree and shrub foliage, stunting growth and potentially killing Oak, Alder, Apple, Aspen, Elm, Crabapple, Birch, Hawthorn, Willow, Poplars as well as 300+ additional species. Each larvae can consume up to one square foot of foliage per day while maturing for six to eight weeks.

Lure will attract Spongy moths *(Lymantria dispar)*

How It Works: VivaTrap! Spongy Moth Traps utilize a strong wet-glue adhesive to retain moths that are attracted to the pheromone lure.

Includes: 2x extra-sticky diamond traps & 2x lures (2 complete traps)

Instructions: Place lure inside diamond trap and position in shrub or hang in tree at 4-5' height. South side of foliage is preferred. Use one trap with lure per shrub or small tree, two traps for larger trees. For best results deploy traps in June when larvae emerge. Lure lasts for 8 weeks depending on temperature.
