## Blue Insect Traps

ARBICO Organics® Blue Insect Traps work as a visual attractant for thrips, leafminers and other flying insects. They are drawn in by the bright color and become hopelessly stuck. This process not only eliminates adult pests, it prevents them from reproducing. If you are interested in monitoring your insect pests, the gridded surface of this trap makes it easy to count.

### How to Use:

Remove the protective covering and either hang the trap or place it on the ground. You can hang the traps virtually anywhere, or use stakes (not included) to anchor into growing medium. If hung, traps should be slightly above the plant canopy. If placed on the ground for crawling insects, make sure the sticky side is up. Avoid using near sprinklers.

- For trapping in the greenhouse or garden, use roughly one trap per 10-25 sq. ft.
- For monitoring, use roughly 4-6 traps per acre.
