Yellow Insect Traps

ARBICO Organics™ Yellow Insect Traps work as a visual attractant for a wide range of crawling and flying insect pests. They are drawn in by the bright color and become hopelessly stuck. This process not only eliminates adult pests, it prevents them from reproducing and creating more to deal with. If you are interested in monitoring your insect pests, the gridded surface of this trap makes it easy to count just how many have been captured.

How to Use:

Remove the protective covering and either hang the trap or place it on the ground. You can hang the traps virtually anywhere, or use stakes (not included) to stick into growing medium. If hung, traps should be slightly above the plant canopy. If placed on the ground for crawling insects, make sure the sticky side is up.

- For trapping in the greenhouse or garden, use roughly one trap per 25-50 sq. ft.
- For monitoring, use roughly one trap per acre.
