The introduction of Biological Control Agents (BCAs) is often a component of an Integrated Pest Management (IPM) program and an awareness of use with BioWorks products is essential to the success of the program.

**BotaniGard 22 WP** and **Mycotrol WPO** – Effective biological insecticides that are used to control many insects and are based on the highly successful fungus, *Beauveria bassiana* strain GHA. The applied spores infect the soft body of an insect directly. Consequently, growers need to be able to assess how they can be used in their IPM program, for example, as a spot treatment or by broad application.

Molt-X – An emulsifiable concentrate with 3% azadirachtin active ingredient derived from the seeds of the neem tree. As an Insect Growth Regulator (IGR), it interferes with the key molting hormone, ecdysone, preventing insects from progressing from one life stage to the next. Please refer to product label for proper application.

Koppert Resource: [http://side-effects.koppert.nl/](http://side-effects.koppert.nl/)

**CEASE** — Used for controlling a wide array of both fungal and bacterial pathogens, while providing outstanding plant and environmental safety. Based on a naturally occurring, patented strain of *Bacillus subtilis* (strain QST 713), CEASE can be used as a foliar spray and soil drench on vegetables grown under cover. Please refer to product label for proper application.

**RootShield/RootShield PLUS** — The RootShield family of products is used to prevent the development of root diseases causing damping off. They will not interfere with the introduction of BCAs inhabiting the soil/growing mix.

**SuffOil-X** — A light horticultural oil used to control insects, along with providing suppression of certain foliar diseases. It is expected that it will harm beneficials, but due to the lack of residue after application, populations can rebuild. Releases can occur after 24 hours from SuffOil---X application. This product becomes very useful in an IPM program for spot treatment of insects.

**MilStop** — A water soluble, broad spectrum, foliar fungicide. The active ingredient is potassium bicarbonate and is known to have a detrimental effect on soft bodied insects. For hard bodied insects apply no later than two days prior to release. Please refer to product label for proper application.

**Resources were reviewed for the compatibility of MilStop and the Cease active ingredient with BCAs and a summary of the findings is provided. Please refer to product label for proper application and your BCA supplier for further information.**

**NOTE:** For non-BioWorks products, we do not endorse or recommend any particular products, treatments, services or diagnoses, whether specifically or generally, and professional advice should be sought in relation to all treatment decisions. We provide information and listings only which we hope is helpful.

Refer to product labels for complete application details. Additional technical information is available on our website (bioworksinc.com) or from your BioWorks technical sales representative.
